

Jefrey Bergl

jbergl@unc.edu | (336) 339-9069 | [Website](#) | [Github](#)

EDUCATION

University of North Carolina at Chapel Hill

Expected Graduation: May 2026

BS Computer Science and Applied Mathematics

Dean's List (5 semesters)

Relevant Coursework: Graduate Machine Learning, Graduate Computer Vision, Graduate Deep Learning, Optimization for Machine Learning, Numerical Analysis, Advanced Programming Language Concepts

RESEARCH EXPERIENCE

UNC Chapel Hill

Oct 2024 – Present

Undergraduate Research Assistant | Advisor: Prof. Thomas Hofweber

- Co-authored *The Black Tuesday Attack: How to Crash the Stock Market With Adversarial Attacks to Financial Forecasting Models* (submitted to Journal of Cybersecurity; see Publications).
- Developed adversarial perturbation framework for financial forecasting models; ran experiments on CNN and MLP architectures.
- Received \$3,000 in undergraduate research funding to support the project.

PUBLICATIONS & PREPRINTS

Thomas Hofweber, **Jefrey Bergl**, Ian Reyes, Amir Sadovnik. *The Black Tuesday Attack: How to Crash the Stock Market With Adversarial Attacks to Financial Forecasting Models*. Submitted to *The Journal of Cybersecurity*, 2025. [arXiv:2510.18990](https://arxiv.org/abs/2510.18990).

PROJECTS

H-JEPA: Learning Hamiltonian Dynamics on Latent Video Embeddings [[GitHub](#)]

Dec 2025

Independent Research | Python, PyTorch, V-JEPA 2

- Designed a latent world model that enforces Hamiltonian mechanics on frozen V-JEPA 2 video embeddings, learning a scalar energy function $H(q, p)$ and evolving states via a symplectic Störmer–Verlet integrator with a learnable timestep
- Achieved $1.9\times$ lower prediction MSE than a parameter-matched baseline MLP on 15-step rollouts, using 30% fewer parameters (919K vs. 1.3M), with bounded energy drift by construction
- Conducted ablation studies isolating contributions of symplectic integration and energy conservation loss, revealing a prediction–conservation trade-off across four model variants

Cost-Effective Brain Tumor Detection with CNNs | *Python, TensorFlow/Keras, scikit-learn* Dec 2024

- Built low-parameter CNN to classify brain MRI scans, minimizing false negatives for prescreening in resource-limited settings.
- Compared against transfer learning baselines (ResNet-50, VGG-16); achieved Accuracy ≈ 0.85 , F1 ≈ 0.87 while reducing false-negative rate and remaining far smaller to deploy. [[Code](#)]

PRESENTATIONS

CoreAI UNC Research Showcase – “The Black Tuesday Attack” [[poster](#)]

Feb 2026

AI@UNC – “Adversarial Attacks on Financial Forecasting Models” [[slides](#)]

April 2025

Selected for Spotlight Presentation

COMP 790: Graduate Computer Vision – “Evaluating Real World ViT Performance” [[poster](#)] May 2025

TECHNICAL SKILLS

Programming Languages: Python, Java
